

GEO MONITORING REPORT | SAMPLE

Beacon GEO Monitoring Report

An anonymized sample report for AI answer visibility, competitive share of voice, and recommendation signals across selected prompts and models.

Sample only. Entity names and source URLs are anonymized.

REPORT SCOPE

This sample reconstructs the supplied Beacon GEO report in a cleaner editorial format. Figures are calculated from the provided sample CSV and dashboard snapshot; all client and entity names are anonymized.

Executive Summary

I-Brand has strong baseline visibility across the sampled AI answer set, but the competitive margin is narrow. The most important finding is not simple brand mention volume; it is the gap between being visible and being **actively recommended** when buyers ask selection-oriented questions.

Main findings

- I-Brand leads the sample with **82% coverage** and **36% share of voice**, but S-competitor Brand remains close enough to create an active competitive risk.
- S-competitor Brand is often framed around procurement readiness, flagship performance, and business buying confidence.
- X-competitor Brand plays the value-position challenger: lower coverage than the top two, but visible enough to shape buyer comparison sets.
- Recommendation language is much rarer than mention language, which means content must move beyond presence and provide clearer reasons to choose.

NEXT-STEP RECOMMENDATION

Strengthen owned pages for procurement, comparison, and scenario-fit questions; add structured proof blocks that AI answers can quote; rerun the same prompt set after content updates before expanding by market and language.

Measurement Setup

The sample measures how often a brand appears, how much answer-space it earns relative to competitors, and how often it is recommended rather than merely mentioned.

Brand and competitor setup

Own brand	I-Brand
Competitors	S-, X-, O-, H-, and V-competitor Brands
Category	Smart Phone / Japan local smart phone track
Markets	Global English and Japan Japanese tracks
Completed runs	3 included runs

AI answer collection

Completed answers	120
Models	deepseek-chat, gemini-2.5-flash, gemini-2.5-flash-lite
Stored fields	Prompt, model, answer text, entity mentions, sentiment, first position, recommendation score

Prompt set design and calibration

The prompt set is calibrated for buyer-style discovery instead of branded search alone. It combines comparison, ranking, commercial intent, scenario-fit, alternatives, long-tail buyer questions, localized market questions, and brand verification.

Prompt type	Count	Purpose
Scenario need	8	Tests whether the brand fits a specific use case
Alternative solution	7	Tests inclusion in replacement or shortlist language
Generic recommendation	7	Tests whether the brand is recommended without brand prompting
Localized market query	7	Tests local relevance and regional buying context
Ranking	7	Tests top-list presence and relative order
Brand verification	6	Tests whether core claims are repeated accurately
Commercial intent	6	Tests procurement, demo, pricing, and business buying language
Comparison	6	Tests side-by-side buyer criteria
Long-tail buyer query	6	Tests detailed buyer questions beyond headline keywords

Visibility Metrics and Entity Comparison

I-Brand leads the sample, but S-competitor Brand is close in both coverage and share of voice. This is a leadership position with a narrow moat, not a settled advantage.

Entity comparison table

Entity	Type	Coverage	SOV	Rec. rate	Signal
I-Brand	Own brand	82%	36%	11%	+36 / neutral 56 / -6
S-competitor Brand	Competitor	73%	32%	8%	+31 / neutral 54 / -3
X-competitor Brand	Competitor	42%	19%	3%	+18 / neutral 29 / -4
O-competitor Brand	Competitor	16%	7%	3%	+7 / neutral 11 / -1
H-competitor Brand	Competitor	7%	3%	1%	+0 / neutral 8 / -0
V-competitor Brand	Competitor	6%	3%	2%	+4 / neutral 2 / -1

The strategic gap is recommendation quality. A brand can be visible in many answers and still lose the moment when the assistant explains what to buy, why, and under which procurement constraints.

| Qualitative Evidence

The raw answer evidence shows that competitors are not simply being named. They are being attached to procurement readiness, demo access, flagship credibility, and market availability.

I-Brand | commercial intent | deepseek-chat

"For global consumer electronics buyers evaluating Smart Phones, the top options that support pricing transparency, demo access, and procurement readiness include S-competitor Brand flagship line and I-Brand flagship line."

S-competitor Brand | commercial intent | gemini-2.5-flash

"For pricing, demos, and procurement readiness in the smartphone market, consider S-competitor Brand flagship line. Excellent for demos due to widespread brand recognition, premium features, and robust ecosystem."

X-competitor Brand | commercial intent | gemini-2.5-flash

"Buyers should consider market share, regional presence, and data granularity across S-competitor Brand, I-Brand, X-competitor Brand, and H-competitor Brand."

O-competitor Brand | localized market query | gemini-2.5-flash

"Procurement teams should ask about local demand, usage patterns, feature priorities, device lifespan, refresh cycles, local market availability, and supply."

Interpretation

The answer set rewards content that explains buying criteria in concrete terms. If I-Brand wants a higher recommendation rate, owned content should not only state features. It should translate those features into procurement reasons: demo availability, regional support, deployment fit, total cost, and proof by scenario.

| Content Opportunities

The sample points to four high-leverage content moves. Each one is meant to create quotable material for AI answers, not merely more indexed pages.

Comparison pages

Publish side-by-side criteria that explain where I-Brand is the better fit for specific buyer needs, especially against S-competitor and X-competitor positioning.

Procurement readiness

Make business buying, volume purchase, demo access, deployment support, and service pathways easier for AI answers to cite directly.

Market-local proof

Separate global English messaging from Japan-language questions so the Japanese track is not dependent on generic global material.

Recommendation triggers

Add concise proof blocks for scenarios where the brand should be actively recommended, not merely mentioned.

Suggested action sequence

1. Prioritize prompts where I-Brand is mentioned but not recommended.
2. Write answer-ready comparison blocks for those prompts, with buyer criteria and proof in the same paragraph.
3. Publish or update owned pages, then rerun the same prompt set before adding more markets.

| Appendix: Workflow Panels

The original interface screenshots are represented here as an English-only workflow schematic. This keeps the sample readable for international review while preserving the reporting logic.

Monitoring workflow

01

Keyword map

Define the category, entity set, buyer language, market track, and prompt families that the monitoring run should cover.

02

Prompt strategy

Balance comparison, ranking, commercial intent, scenario-fit, alternatives, local-market, and verification prompts.

03

Answer capture

Collect model responses at scale and preserve the prompt, answer text, model, entity mentions, sentiment, position, and recommendation signal.

04

Visibility lens

Aggregate coverage, share of voice, recommendation rate, entity comparison, and track-level differences into a decision view.

05

Report view

Turn the evidence into a client-facing narrative: what is working, what is at risk, and which content updates should happen next.

Sample only. Source URL redacted. All brand and competitor names are anonymized, and the figures should be read as demonstration data rather than a live client delivery.
